

TAIL as TURN®

100% PLUG AND PLAY
CONVERTS TAIL LIGHT INTO TURN SIGNAL

Thank you for your purchase of this unique lighting module for your Subaru Forester! With this module, you'll be able to convert your tail light to also function as the turn signal. You also have the option to add additional backup bulbs in the original turn signal location.

1 Open the lift gate to gain access to your tail lights. Using a Phillips screwdriver, remove two screws holding the tail light in place.

2 Pull straight back on the tail light to release the pins holding it in place.

3 Unplug the tail light connector by depressing the clip and pulling out. Plug your new Tail as Turn® module inline between the tail light and the factory connector.

4 If you purchased Diode Dynamics LED bulbs (sold separately), replace the factory turn signal and existing backup bulbs.

NOTE: The factory turn signal bulbs MUST be removed and either left empty or switched to LED.

5 Check the polarity before reinstalling back in the socket. If the bulb does not light up, remove it and flip it 180° and then reinstall.

6 Tuck the wiring, reinstall the tail light back on the vehicle, and replace the two Phillips screws. Repeat for the other side. Enjoy!

CAUTION: Resistors will be hot to the touch when turn signal is activated for prolonged periods. This is normal.
